

Meeting Minutes 11/7/14

1:03 Meeting convened

Introduction

Anji: product purpose: enabling people to change shifts more easily, not to visualize shift schedules

Purpose

Anji/Vicky: employer sets regular shift schedule; employees can change on a week-to-week basis. Manager authentication for schedule swaps later, not part of MVP.

Issue: how to have dynamically-updated calendar

Vivek: having a different shift object for different weeks' shifts is the way to go. Update the backend every Sunday night. Person who gave up shift is still responsible for it until it is claimed. Cron job nightly for managers to know if shift is unfilled. Make sure site is active for the two weeks in which it is graded.

Cynthia: jobscheduler, cron. Have a window for when it's okay to switch shifts (e.g. two weeks).

Security

Vicky: not sure if security list comprehensive.

Mentors: authentication, XSS (sanitizing input), making sure users logged in, proper user for both view and controller

Data Model

Vivek: okay for two different accounts if user has two different roles; schedule = role + list of shifts - good; notification is not MVP; data model is well thought out

Notification Issue

Vivek: who has permissions to do what with regards to manager notification approval; don't need a notion of following a schedule

MVP

Vivek: MVP features look good; 30 min sounds like a good shift granularity

Cynthia: Bootstrap has a calendar
